Project 3

Singapore Travel Fair Campaign

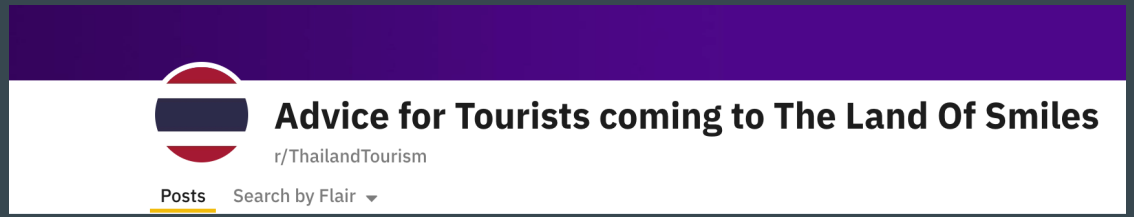
Kenneth Lim

Agenda

1. Problem Statement
2. Data Pre-processing + EDA
3. Data Modelling
4. Results
5. Conclusion and Recommendations

Problem Statement

- Singapore lifts remaining Covid-19 pre-departure testing measures in Feb 2023
- Surge in Travel bookings and holidays among Singaporeans
- Assist Marketing and Operations team in an online local travel technology agency to digitalize their travel promotion packages by training of ML model
- Collection of Subreddit travel posts for feedback analysis



Top searched destinations this winter season[3]

1. Singapore	6. Seoul
2. Bangkok	7. Taipei
3. Tokyo	8. Osaka
4. Bali	9. Johor Bahru
5. Kuala Lumpur	10. London

[3] Based on accommodation search data on Expedia.com.sg during the period of July to November 2022,for travel in December 2022 to February

Why Select Subreddit of these countries?

- “Recent study from the Expedia Team showed that 66% of Singaporeans prioritize experiences and travel over things in life Post Covid-19 Pandemic”

Data Pre-processing

Remove web URLs, non-words and special characters

Tokenize text sentences into lower case words

Filter common stopwords and keywords relating to Japan and Thailand

Pass into CountVectorizer/TFID Vectorizer for N-gram word feature analysis

Data Modelling

Goal: To train a novel prototype NLP Classifier Model that can accurately classify under the correct subreddit categories in long-term for further fine-tuning and deployment

Bag-of-Words

- Overall individual word count
- Word Frequency Count

Vectorization

- Condense individual words into sparse matrix of array

Evaluation Metric

- Reduce Misclassification rate
- Optimize accuracy and ROC-AUC metrics

Classification Algorithms

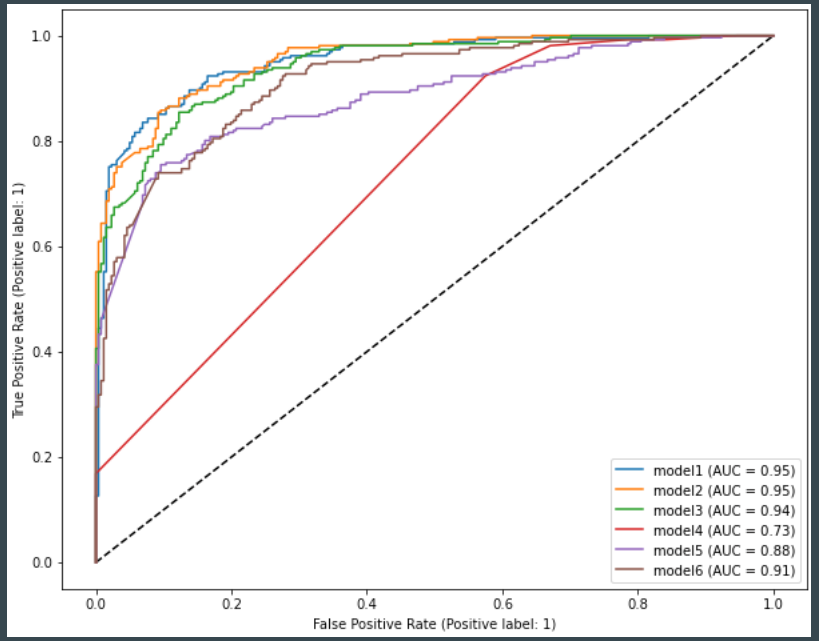
- Naïve Bayes
- Logistic Regression
- Decision Tree
- RandomForest
- GradientBooting

Results

Model No.	Model	Accuracy	Precision	Recall	F1	AUC
1	Multinomial Naive Bayes(CountVectorizer)	0.864	0.961	0.759	0.848	0.95
2	Multinomial Naive Bayes(TFIDF)	0.847	0.913	0.766	0.833	0.95
3	**Logistic Regression(TFIDF)**	0.856	0.881	0.824	**0.851**	**0.94**
4	Decision Tree(TFIDF)	0.655	0.594	0.981	0.740	0.68
5	Random Forest(TFIDF)	0.810	0.812	0.808	0.810	0.88
6	Gradient Boosting (TFIDF)	0.818	0.803	0.843	0.822	0.91

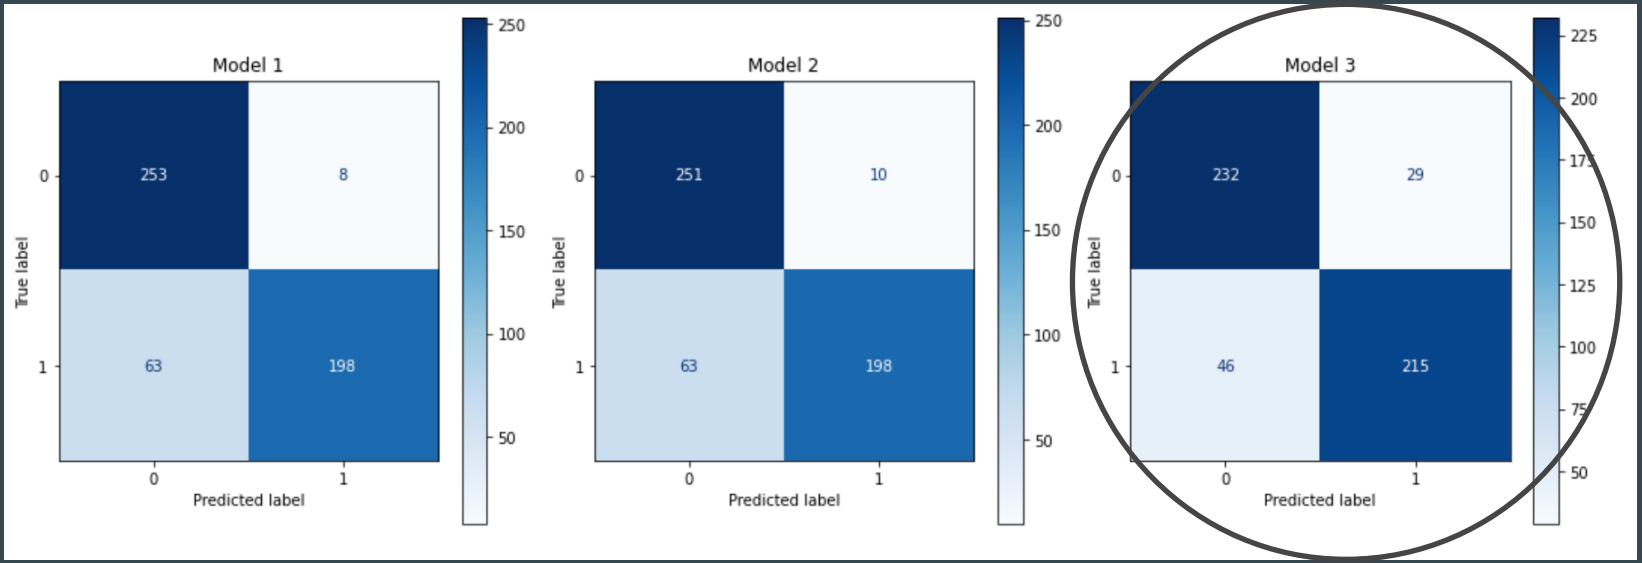
Model No.	Model	Train Accuracy	Test Accuracy
1	Multinomial Naive Bayes(CountVectorizer)	0.882	0.864
2	Multinomial Naive Bayes(TFIDF)	0.924	0.860
3	Logistic Regression(TFIDF)	0.955	0.856
4	Decision Tree(TFIDF)	0.675	0.674
5	Random Forest(TFIDF)	0.824	0.810
6	Gradient Boosting (TFIDF)	0.986	0.818

ROC-AUC Curve



Model No.	Model
1	Multinomial Naive Bayes(CountVectorizer)
2	Multinomial Naive Bayes(TFIDF)
3	Logistic Regression(TFIDF)
4	Decision Tree(TFIDF)
5	Random Forest(TFIDF)
6	Gradient Boosting (TFIDF)

Confusion Matrix

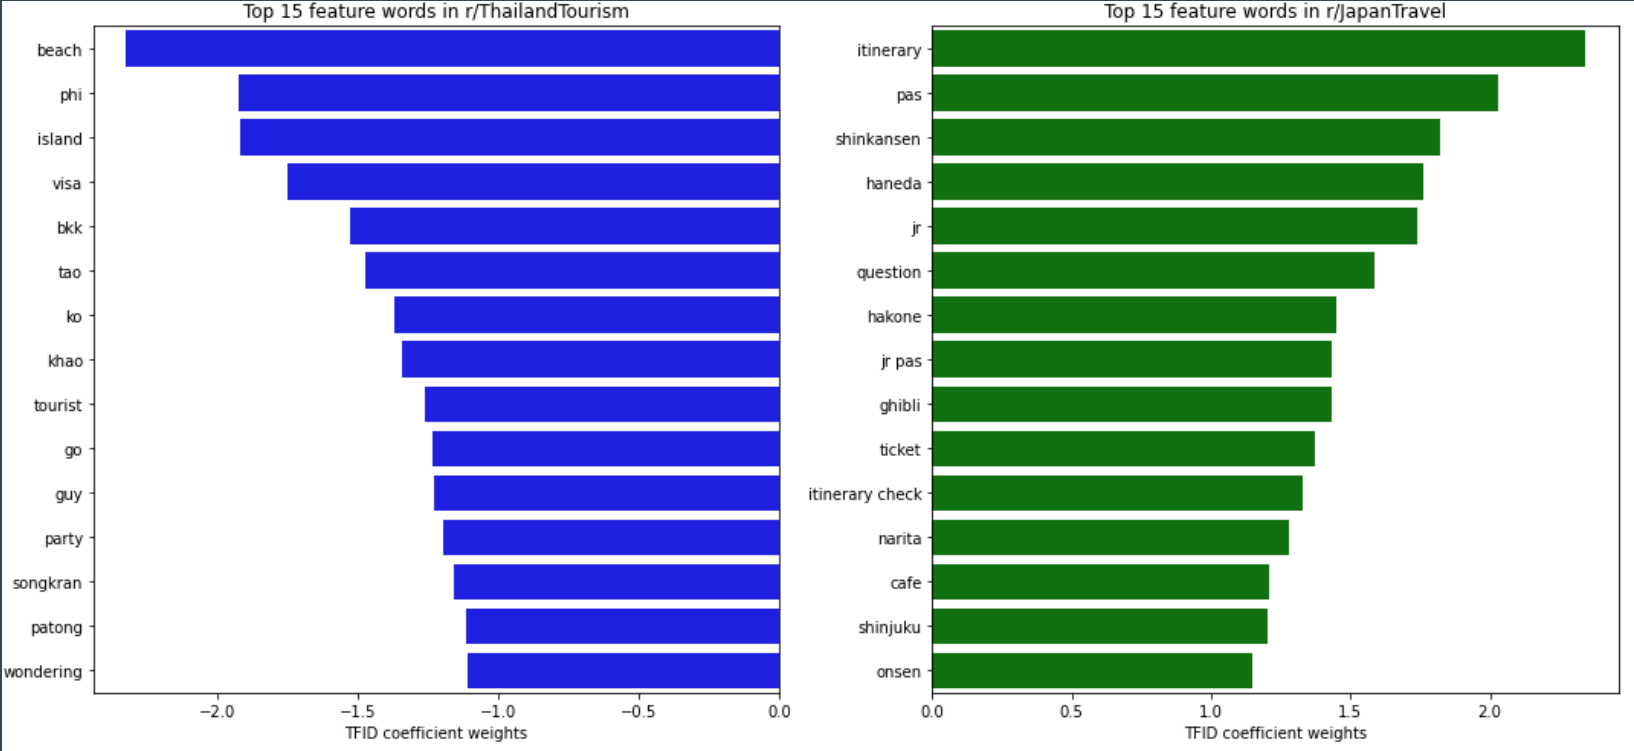


Model 1: Naïve Bayes (CountVectorizer)

Model 2: Naïve Bayes (TFIDVectorizer)

Model 3: Logistic Regression (TFIDVectorizer)

Word Feature Importance



Conclusion

F1 score: 85.1%

- Selected Model for Production: **TFIDF, Logistic Regression**
- **ROC-AUC: 0.94**
- NLP Classifier is successful in gathering and segregating travel feedbacks from the web
- Enables Marketing and Operations team to leverage on this information to execute their campaigns for upcoming travel fairs/fairs

Recommendations

1. Train on larger validation dataset consisting keywords throughout all 4 seasons of the year

2. Deep Learning techniques such as Recurrent Neural Networks for sequential text data. Pre-trained models on existing larger dataset and predict its performance on r/JapanTravel and r/ThailandTourism

3. Employ the model to train on recommendations and feedback from Singapore reviews to validate model's performance
